Refelction:

SortByte is an AI-powered recycling companion designed to eliminate sorting confusion by using image recognition to identify waste and gamify the process with streaks and "Volt" points. We target tech-savvy, eco-conscious users who appreciate efficiency and want a tool that feels like a piece of modern precision software rather than a generic green app. The layout and "Pastel Engineering" color palette—featuring Blueprint Blue and High-Vis Lime—were chosen to evoke a clean, industrial aesthetic that remains soft and visually welcoming. A key challenge was striking the right balance between a "cool" technical vibe and a friendly, accessible user experience that encourages daily use without feeling cold. With more time, I would expand the gamification features to include a rewards marketplace for spending "Volts" and add interactive video guides for the DIY upcycling projects.
